RNAi in stem cells is no longer uncharted territory.

Thermo Scientific Dharmaco Accell siRNA provides a breakthrough in siRNA delivery. It is specially modified for delivery without a separate transfection reagent, and has demonstrated excellent results for gene silencing in numerous difficult-to-transfect cell types. RNAi is no longer constrained by conventional delivery methods that rely on lipid-based reagents, viruses, or instrumentation.

- Effective, specific silencing from the RNAi experts
- Free from toxic delivery effects for pure silencing results
- Proven results in hematopoietic and neural stem cells

Dharmacon Accell™ siRNA delivers target knockdown to any cell type
Thirteen difficult-to-transfect cell lines were treated with Accell Cyclophilin B siRNA in delivery media and assayed for mRNA levels and cell viability after 72 hours. Effective silencing and low cytotoxicity was achieved without delivery optimization.

INTRODUCING OUR NEW

20TH ANNIVERSARY

2011 RESEARCH PRODUCT CATALOG

FROM THE LEADING SUPPLIER
OF RESEARCH PRODUCTS:

- over 16,720 monoclonal and 34,860 polyclonal antibodies
- over 135,300 siRNA and shRNA (plasmid and lentivirus) products
- UltraCruz®, ExactaCruz®, and CrystalCruz® brand labware
- over 141,000 ChemCruz® specialty biochemicals
- broad range of support products and secondary antibodies
- website updated daily with new antibodies, biochemicals, labware, product citations and support data.

Can Your PCR System Profile microRNAs in Serum and Plasma?

Our new miRCRY LNA™ Universal RT microRNA PCR system provides the sensitivity needed to detect microRNA in small and difficult samples:

- **Broad coverage** Profiling of 742 microRNAs using only 70 μL serum/plasma – no need to pre-amplify
- **Superior sensitivity** Quantify individual microRNAs from as little as 1 pg total RNA
- **Excellent reproducibility** Reliable and robust data possible to analyze by melting curves

The system is based on Exiqon’s Locked Nucleic Acid (LNA™) technology resulting in unmatched specificity enabling detection even of AT-rich microRNAs with single nucleotide discrimination.
