Figure S2. Translocation of TsuA-YFP foci relative to position of MTOC.
Images of TsuA-YFP in a wild-type cell were captured at 4 second interval. In the left panel taken from 68-second image, two foci of interest are labeled with red and turquoise arrows and their locations are traced with corresponding colored dots in the right lower panel. The locations of MTOC are traced with yellow dots. The filled red arrow indicates the fusion of two foci to form the red foci. The hollow arrow indicates the co-migration of the red and turquoise labeled foci. Bar, 3µm.
